

USER GROUP LIST & USER MATRIX

Global Health Trusted Research Environment (TRE)

Project purpose: Make overlooked health data easier to organize, protect, compare, and use for approved medical research.

Note: These are the expected user groups for the current project design. The researcher persona (Dr. Ezer Kang) is based on a real interview, while the personas for doctors, organizations, and health-data staff are preliminary and will be refined after further interviews.

1. User Group List

The platform has five main categories of users. Some users provide or approve data, while others use the data for research. The system team supports and maintains the platform.

A. Data Providers and Local Research Staff

- **Frontline doctors and clinical research coordinators:** collect or upload clinical and research data, explain local terms, and correct missing or unclear information.
- **Local hospital or clinic research staff:** help prepare records and research data for approved use.
- **Local university researchers:** provide study data and explain how the data was collected and what the fields mean.

B. Research Data Users

- **University and academic medical researchers:** search for approved datasets, review data quality and origin, request access, and analyze data.
- **Pharmaceutical and biotech research teams:** use approved data to study diseases, patient groups, treatments, and outcomes.
- **Hospital and health-system researchers:** use organized data for clinical research and population-health studies.

C. Public Health and Program Users

- **Government health agency researchers and data staff:** use data for disease tracking, planning, public-health studies, and cross-region comparisons.
- **Nonprofit and global-health program staff:** use data to understand disease burden, measure program results, and review funded health projects.

D. Data Owners and Access Approvers

- **Hospital, university, and government data custodians:** review data-access requests, set permissions, protect patient information, and keep control over how data is used.

E. Platform Administration and Support

- **TRE administrators and software/data team:** manage users, permissions, security, data processing, system health, and partner support.

2. User Matrix

The matrix below summarizes the expected knowledge, technology comfort, and use of the TRE for each user group. The experience levels are initial estimates and should be checked during stakeholder interviews.

Category	User Group	Relevant Knowledge / Skills	Web Experience	Software Experience	Main Use of the TRE	Expected Frequency
Data provider	Frontline doctor / clinical research coordinator	Clinical care, patient records, study data, local terms and context	Medium-High	Medium	Upload data, explain fields and terms, review errors or missing information	Daily or weekly during an active study
Data provider	Local hospital / university research staff	Research collection, study documentation, local data practices	High	Medium-High	Prepare and upload data, add documentation, review standardized results	Weekly during active projects
Research user	University / academic medical researcher	Study design, clinical or population-health research, data analysis	High	High	Find datasets, review origin and quality, request access, analyze approved data	Several times per week during active research
Research user	Pharma / biotech research team	Clinical research, real-world evidence, patient populations, data analysis	High	High	Find approved datasets, compare populations, run secure analyses	Several times per week during active research
Research user	Hospital / health-system researcher	Clinical research, hospital data, patient outcomes	High	Medium-High	Search, request, compare, and analyze organized health data	Weekly or as research projects require
Public health / program user	Government health agency researcher / data staff	Public health, disease tracking, data governance, policy needs	High	Medium-High	Review trends, combine approved data, support planning and research	Weekly or monthly, depending on program needs
Public health / program user	Nonprofit / global-health program staff	Program management, research funding, health outcomes, partner coordination	High	Medium	Review data from funded projects, compare locations, measure program results	Weekly or monthly
Access / governance	Institutional data custodian / approver	Privacy rules, data ownership, access policy, institutional requirements	High	Medium-High	Review access requests, set permissions, monitor approved use	As requests arrive; usually weekly
System support	TRE administrator / software and data team	System security, user management, data processing, cloud tools, support	High	High	Maintain the platform, manage users, monitor security, support data processing	Daily

Note: Experience levels and frequency are initial estimates for the class project and will be updated after stakeholder interviews.
